Cleaning and Maintenance of PVD Coatings

Mediclinics products with PVD coatings require proper cleaning to preserve their appearance and maintain the quality of their finish over time.

For routine cleaning, use a **glass cleaner and a clean, soft microfibre cloth or soft paper towel**. Apply the cleaning product to the cloth, avoiding the excessive use of liquid directly on the surface.

Gently clean the product without applying excessive pressure and always **following the direction of the brushing**. This is particularly important to preserve the uniformity and original appearance of the finish.

Once cleaning is complete, make sure that no cleaning product residue or moisture marks remain on the surface.

Recommendation: Do not use scouring pads, abrasive sponges or harsh cleaning products that could scratch or damage the PVD coating.
